Software Engineer - Integrations

Apply for this job

Apply for this job

We are looking for an engineer who wants to build the foundation of our new Integrations effort: the connectors that bring our customers' data from third-party systems into the Trackunit platform. The connectors you build directly support our new partnership business, one of our key goals for next year. You will be among the first developers on this project, designing a reusable architecture and working directly with the engineers behind the systems we connect to, as well as seeing customer feedback shape what you build next. You might have a couple of years or be an experienced senior engineer, either way, we would be interested in seeing your application for this role.

What's in it for you?

- **Shape how the work gets done.** Join a new, small team set up next to an established platform team, and help define how integrations get built here.
- **Hear directly from the people using what you build.** Customer feedback feeds straight back into the roadmap, and we act on it quickly.
- **Collaborate beyond your own codebase.** You'll have regular, technically focused conversations with developers from the systems we connect to.
- **Learn from experts who share.** You'll work with experienced domain experts who are open to sharing what they know, so you learn quickly.

- **See your work ship.** We favour small, frequent releases over long project cycles, so progress is visible fast.

Who are you ideally?

You are a backend developer with strong Java skills, just as comfortable at the edges where systems meet as inside your own codebase.

- Strong hands-on experience with Java, Spring Boot, Kafka, and REST APIs, in particular consuming data from other systems, in a microservice architecture.
- Experience designing new, reliable, reusable architecture for integrating with multiple systems. System-to-system integration experience is what we value most.
- You are comfortable discussing technical feasibility and approaches with third-party technical teams.
- You care what happens when data moves between systems, so you build with quality, observability and reliability in mind and you know quickly when something breaks.
- You are motivated by incremental delivery, enjoy getting close to the data, and like building new foundations from scratch.

You embrace AI as part of how you engineer. From prototyping through to production, you use AI tools as an integrated part of your workflow, not as a shortcut but as a force multiplier. That said, this isn't the main thing we're hiring for: curiosity and a willingness to use it well matter more than deep prior experience.

Don't meet every single requirement? No worries, this is what we're looking for ideally. If you're excited about this role but your background doesn't align perfectly with every point above, we encourage you to apply.

Primary responsibilities

- Design a reusable architecture for integrating with multiple third-party systems, not one-off solutions.
- Build connectors that collect data from third-party systems, usually ERPs, mainly by consuming their REST APIs, and bring it reliably into our platform.
- Understand the data you collect and transform it into Trackunit's data model.
- Work with third-party vendors: discuss technical feasibility and approaches with their technical counterparts.
- Build with quality, observability and reliability in mind, on our microservice and event-driven architecture.

Our hiring process

Don’t waste your time writing the perfect cover letter. We want you to create an impact that matters - and that’s not in the cover letter.

- Initial phone conversation with a colleague from our P&T team.

- Virtual meet and greet with your potential new leader and someone from the team, so you'll get to know the role and team better.

- Assignment-specific interview with the hiring manager and a lead engineer from the team. We want to give you a real insight into the work. You'll receive a case to prepare ahead of the interview and present to relevant colleagues - people you'll also work closely with in the role.

- If needed, we will obtain references from former employers and conduct background checks at relevant levels.

- Offer presentation and walk-through.

Coming Together To Connect Construction

We're committed to construction - one of the largest industries in the world. Over the past two decades, Trackunit has been pioneering technological progress within construction. Today, we are not only a leading IoT provider but a thought leader, supporting and shaping the agenda for an entire industry on a global scale.

We believe in taking a people approach in everything we do. Being human-centric is not restricted to our products - it's a way of life at Trackunit. We're proud to be a truly global team. Our colleagues come together in hubs spread across the globe, but we embrace the idea of working remotely and in environments that inspire you. Everything we do, we do to eliminate downtime and build the most useful industry for the world.

The question is: Are you in?

About Trackunit

Trackunit is the leading operating data platform connecting people, assets, and processes in construction.

A global technology company connecting the construction industry - by orchestrating data and infrastructure - to build the most useful industry for the world.

We connect construction through one platform to create a living, evolving ecosystem that delivers data and insights to the off-highway sector. With more than 2 million assets connected and more than 2 billion data points collected each day, we use technology to eliminate downtime, improve safety, and help customers improve the bottom line in a sustainable, cost-effective way.
